INSIGHTS

- ➡ Out of a total of 2,954 pregnancies, 44% (1,304) were diagnosed as diabetic, while the remaining 56% (1,650) were categorized as non-diabetic.
- ➡ Among the 768 individuals surveyed, it was found that 268 of them were suffering from diabetes. Additionally, within this group, 219 patients were classified as obese, with a BMI exceeding 30, while 34 patients were identified as overweight, with a BMI ranging from 25 to 30.
- ➡ In the survey of 768 individuals, 268 of whom were diabetic patients, it was observed that 167 had a diastolic blood pressure reading within the healthy range of 50-80 mm Hg, while 77 fell within the range of 80-120 mm Hg, and 24 exhibited a diastolic blood pressure below the recommended healthy threshold of 50 mm Hg.
- ➡ A notable observation in the study is that the majority of diabetic women are within the age range of 20-60. Among this group, 90 women fall within the 20-30 age bracket, 76 are in the 30-40 age range, 64 belong to the 40-50 age category, and 31 are situated in the 50-60 age group.
- ➡ In the diabetic patient group, 138 individuals showed an insulin reading of 0 mu U/ml, often linked to type 1 diabetes, where the immune system damages insulin-producing cells.
Also, 111 diabetic patients had high insulin levels (> 105 mu U/ml), while 17 had moderate levels (< 100 mu U/ml). These varied insulin profiles provide insights into diabetes management.
- ➡ The majority of diabetic patients exhibit plasma glucose concentrations between 126 and 200 mg/dL during a 2-hour oral glucose tolerance test.
- ➡ The majority of diabetic patients typically exhibit an average skin thickness ranging from 16.71 mm to 25.22 mm.
- ➡ A majority of patients, specifically 65%, fall within the low-risk category based on the Pedigree Function group, falling between values greater than 0.1 and less than 0.5. Additionally, 29% of patients are classified as being at moderate risk, with values ranging from greater than 0.5 to less than 1. Only a smaller subset, comprising 6% of patients, are positioned in the high-risk category, characterized by Pedigree Function values exceeding 1.
